Lab 6 – Mad Lib with Java Script

You will be creating a mad lib. A mad lib is a child's activity in which the child asks for several words or items. These items may be but are not limited to verbs, nouns, adjectives and numbers. Then using these user inputted items a sentence or story is created.

If you are unfamiliar with mad libs, you may want to go to the internet to look up the concept.

You will be creating a mad lib. You must request at least 5 items from the user. How this information is entered is up to you. You can use a form with textboxes or you could use prompt box or another other method you chose. Then you must create a simple story with these items. Your story maybe displayed in any fashion you chose, on the page or in a message box for instance.

When creating your page, you must decide who your "target" audience is and gear it in that direction. This target audience may be an age or people who have a common interest like snowboarders. You should mention this target audience in your comments at the top of your code. You page must be pleasing to look at and user friendly.
